Redflex is an international government software provider, specializing in software solutions for law enforcement. The nature of Redflex’s business means most of its clients are public sector organizations that handle sensitive data. These clients need the highest level of security and must meet CJIS compliance requirements, which is a subset of FedRAMP.

Redflex needed to demonstrate that it could create a highly secure, CJIS-compliant environment quickly.

When Redflex and Anitian presented the proof-of-concept to the law enforcement organization, the project was greenlighted and moved to production. The highly secure environment was created in a matter of hours and additional, equally secure environments could be spun equally as quickly, allowing law enforcement to leverage the AWS cloud platform while maintaining high levels of security. Just as importantly, the entire environment set-up process uses automation processes and configurations that eliminate the possibility of security vulnerabilities caused by human error.
Redflex was able to go to market with this software, pass the CJIS audit and move into production about 80% faster than if it had built the security and compliance framework from scratch. In addition, the total cost of partnering with Anitian was about half what it would have cost to create a high-security cloud environment from scratch.

“Anitian Compliance Automation is revolutionizing compliance,” says Anitian CEO Andrew Plato. “It eliminates all complexity and frustration of building and maintaining a compliant environment. In a few hours, Anitian can have an entire audit-ready environment up and running on AWS.”

About Redflex

Redflex provides software solutions for law enforcement agencies, routinely handling very sensitive data. With headquarters in Australia, Redflex has hundreds of law enforcement clients around the globe.
